Metabolism and Pharmacology of Ethanol

Prof. David W. Craig
Dept. of Chemistry
Hobart and William Smith Colleges
Behavioral Manifestations of Alcohol Ingestion

- With 1 to 2 drinks (.01-.05 g/dL BAC) -- euphoria and perceived reduction in anxiety
- With 3 to 5 drinks (.06-.10 g/dL BAC) -- judgement and motor coordination impaired, sometimes increased aggression
- With 10 to 13 drinks (.20-.25 g/dL BAC) -- sedation
- With 0.30 g/dL BAC -- memory impairment and loss of consciousness
- With 0.40 to .50 g/dL BAC -- depressed respiration, coma, death

*BACs for inexperienced user
What Factors Determine a Person’s Blood Alcohol Concentration (BAC in g/dL)?

- Number of Drinks Consumed
- Body Size and Build
- Sex
- Time
- Past Drinking Experiences
- Is Stomach Empty or Full?
Ethyl alcohol

**Dose – Number of drinks consumed**

- 12 oz Beer 3.6-4.0% alcohol contains 13-17g alcohol
- 4 oz Wine 12-14% alcohol contains 14-17g alcohol
- 1-1.5 oz 80 proof Whiskey contains 12-18g alcohol

**But**

**Long Island Iced Tea**: 1oz vodka (40%), 1oz tequila (40%), 1oz rum (40%), 1oz gin (40%), 1oz triple sec (40%), 1.5oz sweet and sour mix, splash cola. 59g alcohol ~4 drinks

**Four Loko**: 23.5oz 12% alcohol 85g alcohol ~5.5 drinks
Ethyl alcohol

\[ CH_3-CH_2-OH \]

Body size, build, and sex determines the volume accessible to ethanol

Chemical Solubility

- Completely soluble in water
- Somewhat soluble in fat
- 30x more soluble in water than in fat

Proportion water in the body: Men .58, Women .49
Time – How rapidly can ethanol be absorbed?

Rate of absorption is dependent on:
- concentration gradient between gut and blood
- surface area of contact
- degree of vascularization

Effect of Food on Absorption
- food dilutes alcohol in the digestive system
- fatty foods are slow to digest and slow to move from the stomach to the small intestine
Time – How rapidly can ethanol removed?

- Ethanol clearance is zero order ... the rate of clearance is independent of the ethanol concentration

- Average ethanol clearance rates
  - For moderate drinkers - 0.017 g/dL/hr
  - Drinkers consuming >60 drinks/month - 0.020 g/dL/hr
  - 80% of adult population > 0.012 g/dL/hr
## Estimation of BAC

### Calculation of BAC for moderate drinkers -- The American Happy Hour Experience

BAC distribution of HWS students returning home late at night

Late night blood alcohol concentration on school and weekend nights (12F and 13S terms) N=348

- School Night (N=265)
- Weekend Night (N=83)
BAC distribution of HWS students returning home late at night

Late night blood alcohol concentration on school and weekend nights (12F and 13S terms) N=345

- Males (N=200)
- Females (N=145)
What if we were to continue for five drinks?

BAC Time Course

No. Drinks

BAC (g/dL)

Time (hr)
Effect of Rate of Ingestion of 10 Drinks on BAC (following a light meal)

Absorption
Elimination

5 drinks/hr
2 drinks/hr
1 drink/hr
Major Pathway for Alcohol Metabolism

- **Ethanol**
  - NAD $\rightarrow$ NADH
- **Acetaldehyde**
  - NAD $\rightarrow$ NADH
- **Biosynthesis**
  - Acetic Acid $\rightarrow$ CO$_2$ + H$_2$O
- **Release to Blood**

*Alcohol DH*

*Aldehyde DH*
Women are smaller than men

Women have lower total body water content (49%) than men (58%) of comparable size

Gastric ADH lower in women
  - virtually nonexistent in alcoholic women
  - declines in men over 50

Fluctuations in gonadal hormone levels during the menstrual cycle may affect the rate of alcohol metabolism

SOURCE: Alcohol Alert #10, NIAAA (1990)
Metabolic Differences Between Racial Groups

- Isoenzymes in Alcohol DH (ADH)
  - Beta1 in Caucasian has Km 0.00023 g/dL
  - Beta2 in Asian has Km 0.0043 g/dL
  - Beta3 in 15% African Amer. has Km .165 g/dL

- 50% Chinese and Japanese Asians have inactive mitochondrial Aldehyde DH (ALDH) resulting in facial flushing, palpitations, dizziness, and nausea
Effect of Chronic Use

- Metabolic Tolerance

But….This is not the whole story….more to come
Alcohol on the Brain
Behavioral Manifestations of Alcohol Ingestion

- With 1 to 2 drinks (0.01-0.05 g/dL BAC) -- euphoria and perceived reduction in anxiety
- With 3 to 5 drinks (0.06-0.10 g/dL BAC) -- judgement and motor coordination impaired, sometimes increased aggression
- With 10 to 13 drinks (0.20-0.25 g/dL BAC) -- sedation
- With 0.30 g/dL BAC -- memory impairment and loss of consciousness
- With 0.40 to 0.50 g/dL BAC -- depressed respiration, coma, death

*BACs for inexperienced user
The Brain’s Division of Labor

- **Voluntary muscle movement, motor area for speech, emotional behavior, complex intellectual abilities**
- **Receives sensory impulses (pain, hot, cold), and awareness of body parts**
- **Coordinate body movement, balance**
- **Hearing, taste, smell**
- **Metabolism, temperature, activity level, appetite, sexual desire, reproductive cycles**

Alcohol Affects Neurotransmitter Function in the Brain

- Potentiates GABA receptor function
- Inhibits Glutamate receptor function
- Increases Dopamine concentration
- Increases Seratonin release
- Stimulates Opiate Neuropeptide Release
Affect on Dopamine, Serotonin, and Endogenous Opiates (BAC ~ .01-.05 g/dL)

- Dopamine stimulates pleasure centers and functions in positive reinforcement
  - alcohol increases Dopamine concentrations in nucleus acumbens and other reward centers

- Serotonin functions in mood, sleep and positive reinforcement
  - alcoholics and thrill seekers have low serotonin levels and alcohol consumption (and thrill activities) brings these levels up to normal.
  - Serotonergic drugs have reduced alcohol consumption by alcoholics.

- Endorphins and Enkephalins are natural neural peptides that bind to opiate receptors and produce euphoric effects.
  - Endorphins and Enkephalins are released by the brain when exposed to alcohol
  - Euphoria seems to stimulate further drinking
Affect on GABA function (BAC $\geq .06 \text{ g/dL}$)

- GABA is major inhibitory neurotransmitter controlling “arousal state” and sensory and motor activity
- Alcohol Potentiates GABA receptor function
- GABA receptor is site of action of
  - sedative/anesthetic barbiturate, pentobarbitol
  - sedative/anxiolytic benzodiazepines
- RO 15-4513 overcomes motor impairment
Affect on Glutamate Function (BAC ~.02--.2 g/dL)

- Glutamate is major excitatory neurotransmitter
- Alcohol inhibits NMDA glutamate receptor function
- Impaired NMDA Glutamate Receptor Function Causes:
  - cognitive impairment and amnesia
  - inability to learn new information
- Alcohol parallels action of PCP or “angel dust”
Effect of Chronic Use

- **Tolerance**
  - changes in number and types of GABA receptors
  - Increase in number of glutamate receptors

- **Withdrawal**
  - increased Anxiety within hours -- GABA
  - seizures -- Glutamate

- **Dependence**
  - changes in Dopamine and Seratonin function appear to be long lasting
What Causes a Hangover?

- **Pounding Headache**
  - Caused by reduced blood pressure in cranial vessels
  - Toxicity/withdrawal

- **General Lethargy**
  - Caused by buildup of lactic acid and acidosis by release of acetic acid

- **Hypersensitivity to Light and Sound**
  - Alcohol withdrawal leads to increased excitability, depressed mood, and sensitivity to stimuli

- **Queasy Stomach**
  - Empty stomach, overly acidic
  - Also due to withdrawal

- **What about taking a drink to relieve hangover symptoms?**
Alcohol and Sex

- **Physiological responses**
  - Erections slower to rise and quicker to fall
  - Reduction in vaginal lubrication

- **Psychological Perceptions**
  - 45% of men and 68% of women say alcohol enhances sexual enjoyment

- **Rutgers study (2-3 standard drinks)**
  - Subjects who thought they drank alcohol were most highly aroused (those that did not actually get alcohol were slightly less aroused)
  - Subjects who expected tonic but actually got alcohol were less aroused than those that expected alcohol but did not.
Medications for Alcohol Dependence
Drugs Used in Alcohol Dependence Treatment

- **Disulfiram (Antabuse)**
  - Inhibits aldehyde dehydrogenase
  - Produces negative reinforcement on alcohol consumption

- **Naltrexone**
  - Blocks euphoric effect of opioid receptor activation

- **Acamprosate (Campral)**
  - Reduces symptoms of alcohol withdrawal by inhibiting Glutamate receptor and potentiating GABA receptor
Important Metabolic Interactions and Health Concerns
Major Pathway for Alcohol Metabolism

- Ethanol
- Aldehyde DH
- Acetaldehyde
- Aldehyde DH
- NAD → NADH
- Biosynthesis
- Acetic Acid
- CO₂ + H₂O
- Release to Blood
Interaction with other Drugs

- Ethyl ester of Cocaine
  - potentiates cocaine “high”

- Aspirin and Cimetidine Inhibits Gastric ADH

- Liver Drug Detoxification Impaired
  - Depleted NAD impairs livers ability to clear other drugs
Metabolic Fates of Excess Ethanol and Acetaldehyde

- Ethyl esters of Fatty Acids and Cholesterol
  - may cause heart damage, impair energy metabolism, disrupt cell membranes

- Protein Modification by Acetaldehyde
  - enzymes inactivated by imine adducts

- Ethanol can also be oxidized by MEOS/Cytochrome P450
  - MEOS oxidation produces harmful free radicals
Other Metabolic Processes Affected by Alcohol Metabolism

- High NADH/NAD ratio:
  - Impaired Energy Metabolism and increased production of lactic acid
  - Inhibits Lipid Degredation in Liver
  - Stimulation of fat synthesis and increases in LDL and HDL levels
  - Inhibition of oxidative steps in testosterone synthesis
Other Metabolic Processes Affected by Alcohol Metabolism

- Acetaldehyde Adducts
  - tubulin-mediated protein exocytosis and endocytosis inhibited....insulin, etc
  - Impaired Protein Synthesis Type II Muscle Fibers depleted
  - In alcoholics, acetaldehyde reacts with dopamine to become tetrahydroisoquinoline (THIQ) in the brain. It is thought that accumulation of THIQ is related to addiction.
